Medical Report

Patient: Mr. Peter Paulus, born on September 3, 1950, residing at Kastanienallee 8, 10435 Berlin, patient number 348762, was admitted for staging at the initial diagnosis of colon cancer.

History:

Mr. Paulus reported persistent changes in bowel habits, occasional blood in the stool, and unintended weight loss in recent months. These symptoms prompted further diagnostic evaluation.

Findings:

A colonoscopy revealed a malignant tumor in the ascending colon. Computed tomography of the abdomen and thorax was performed to exclude possible metastases and to determine the stage of the disease. No distant metastases were found.

Diagnosis:

Colon cancer, localized in the ascending colon, clinical stage II.

Treatment:

The decision was made for surgical resection of the affected colon section. The surgery is planned to completely remove the tumor and take the surrounding lymph tissue for histological examination. Postoperative adjuvant chemotherapy is considered depending on the results of the histopathological analysis.

Follow-up:

Mr. Paulus will be closely monitored after the surgery to secure recovery and detect early signs of possible complications. Regular follow-up appointments are set to assess the response to the therapy and minimize the risk of recurrence.

Recommendations:

Mr. Paulus is recommended to keep physically gentle post-operatively and maintain a balanced, high-fiber diet. Further, he should regularly attend follow-up examinations and watch for new symptoms.

Kind regards,

Dr. Anna Müller
